8

9

A data communication system comprising:

a first network including a first plurality of nodes, said first network having a first 4 5 network address;

a second network including a second plurality of nodes, said second network having a second network address; and

means for forwarding, from said first network to said second network, message information received at said first network and addressed to a first place of said first plurality of nodes when said first node establishes communication with said/second network.

29 30 2. The data communication system of claim 1 wherein said means for forwarding

The data communication system of claim 2 wherein said internetworking node 3.

includes an internetworking node included within said first plurality of nodes and within said

- means for receiving a first/set of network information relating to said first network from said first plurality of nodes, said first set of network information identifying a first network access point associated with said first network wherein said message information is available from said first network access point; and
- means for transmitting, to one of said second plurality of nodes, said first set of network information and an identity of said internetworking node.
- 4. The data communication system of claim 3 wherein said one of said second plurality of nodes includes means/for broadcasting said first set of network information, said first node including means for receiving said first set of network information broadcast by said one of said second plurality/of nodes upon establishing communication with said second network.
- 5. The data communication system of claim 1 wherein said means for forwarding includes means for transmitting said message information over a communication link between one of said first plurality and one of said second plurality of nodes.

6. A data communication system comprising:

a first network including a first plurality of nodes, said first network having a first network address and a first network access point for receiving message information directed to said first network;

a second network including a second plurality of nodes, said second network having a second network address; and

an internetworking node means for forwarding at least a portion of said message information from said first network access point to said second network when one of said first plurality of nodes establishes communication with said second network.

7. A data communication system comprising:

a first wireless network including a first plurality of wireless nodes, said first network having a first network address;

a second network including a second plurality of wireless nodes, said second network having a second network address; and

means for forwarding, from said first wireless network to said second wireless network, message information received at said first wireless network and addressed to a first node of said first plurality of wireless nodes when said first wireless node establishes communication with said second wireless network.

8. The data communication system of claim 7 wherein said means for forwarding includes an internetworking node included within said first plurality of wireless nodes and within said second plurality of wireless nodes.
